Stanford MEDICINE

Case

24YO right handed male with congenital onset and minimal progression of:

- Bilateral ptosis without diplopia
- Mild dysarthria without dysphagia
- Generalized weakness
- Areflexia
- Hypotonia
- Chronic fatigue
- Intermittent vertigo and lightheadedness
- Chronic headaches

Not present: dysmorphism, structural brain or eye disease, skin changes, contractures, autonomic symptoms

Birth history: full term, uncomplicated pregnancy, elective C-section
Development: delayed motor milestones, essentially normal cognitive function
Past medical and surgical history: OSA, migraine with aura, occipital neuralgia, Zenker's diverticulum
Family history: older sister with multiple sclerosis, maternal uncle with ALS

Stanford MEDICINE

Examination (age 24)

Normal:
- General examination
- Mental status
- Sensation
- Coordination
- Gait

Abnormal:
- Cranial nerves: mild dysarthria, bilateral ptosis mildly worse with sustained upgaze, facial diparesis
- Motor: see table
- Bulk: low throughout
- Tone: mildly reduced in arms and legs
- Reflexes: trace patellar only

Action	Right	Left	Action	Right	Left
Shoulder abduction	**4+**	**4+**	Hip flexion	5	5

Thumb abduction	5	5	Great toe dorsiflexion	5	5

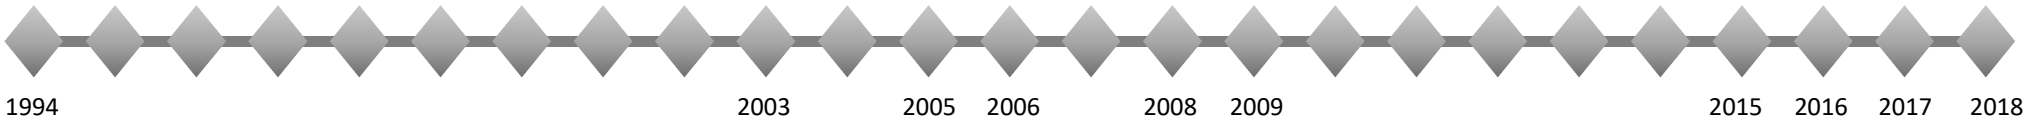
Stanford MEDICINE

Our patient, age 24

Explicit consent from the patient was given to show this video at the Carrell-Krusen conference

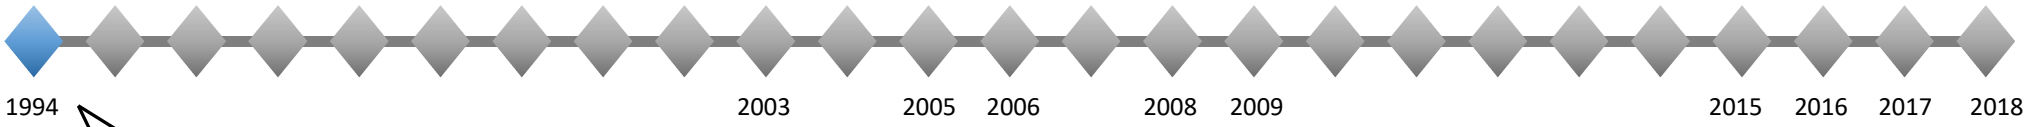
Stanford MEDICINE

Previous workup



Stanford MEDICINE

Previous workup

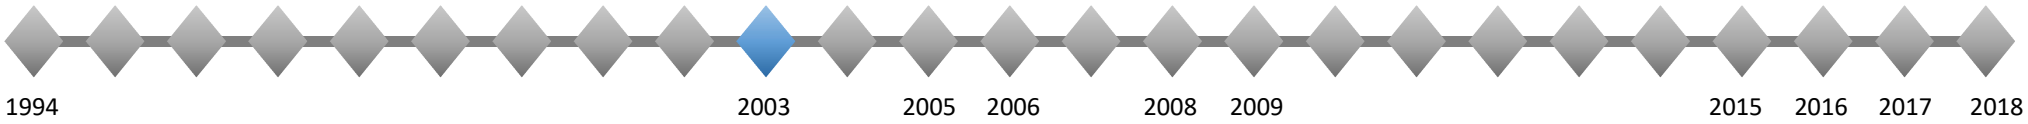


1994:

- Karyotype: 46XY
- Genetics screening evaluation: normal
- Skeletal survey: no evidence metabolic bone disease
- MRI brain WO: normal
- Ophthalmology and audiology exams: normal

Stanford MEDICINE

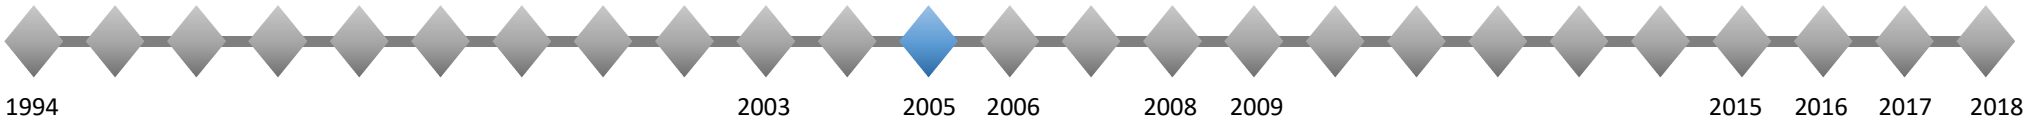
Previous workup



2003:
- EMG/NCS: "generalized myopathy"
- Lysosomal enzyme analysis: normal

Stanford MEDICINE

Previous workup

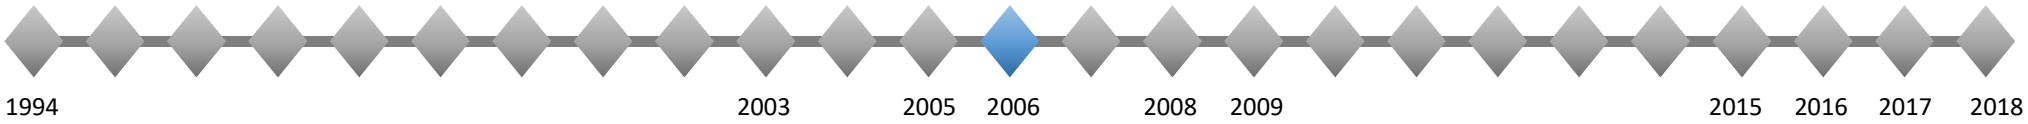


2005:

- EMG/NCS: early recruitment of short-duration motor unit action potentials in proximal and distal muscles, no evidence of polyneuropathy
- Left biceps biopsy: “scattered sub-sarcolemmal deposits of mitochondria but no ragged red fibers” otherwise normal

Stanford MEDICINE

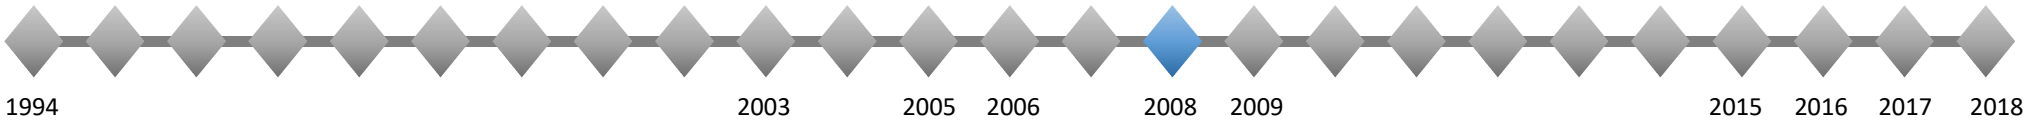
Previous workup



2006:
- Genetic testing for MELAS, MERRF, NARP
- Elevated myoglobinuria
- Decreased phosphofructokinase activity

Stanford MEDICINE

Previous workup

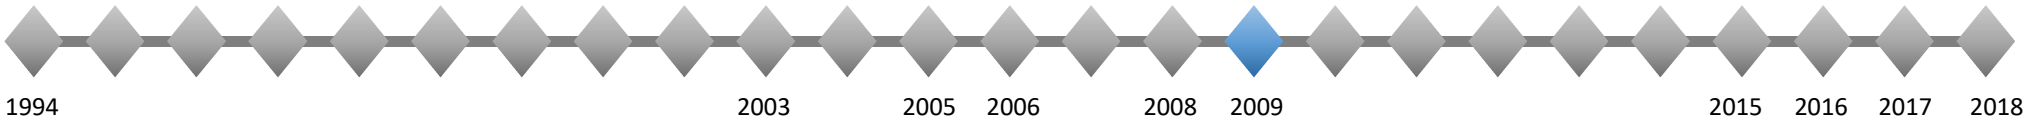


2008:

- Glycolytic enzyme panel: normal
- Ischemic forearm testing: normal increase in lactate and ammonia
- CK “normal”
- Plasma amino acids and urine organic acids normal
- Right vastus lateralis biopsy: normal
- CT head WO questionable clival lesion (limited by artifact from braces)

Stanford MEDICINE

Previous workup

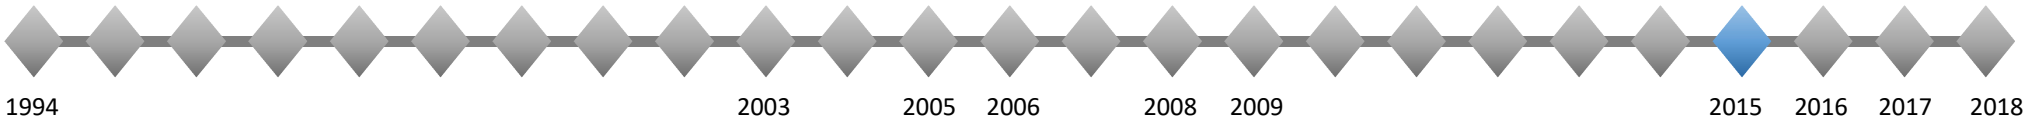


2009:

- MRI brain W/: No clival lesion, small foci of T2 prolongation in parietal white matter bilaterally
- MRI whole spine WO: small syrinx from T5-T10
- Sleep study: AHI 2.2, delayed REM onset, reduced REM stage duration
- ENT evaluation with tongue/pharynx hypotonia
- FEES: normal
- Vestibulonystagmogram: saccades of slow velocity and long latency with abnormal air calorics

Stanford MEDICINE

Previous workup



2015:

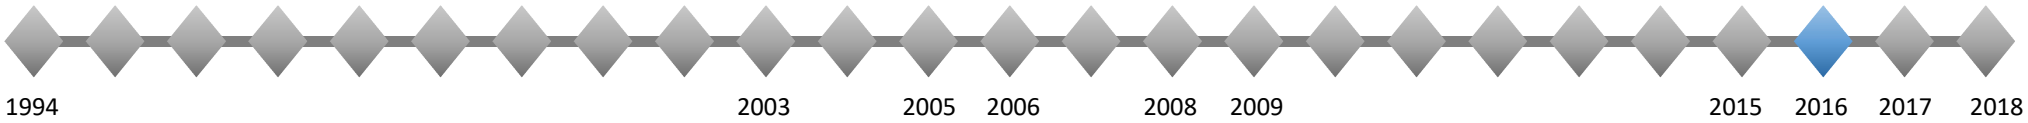
- Left quadriceps biopsy: FINAL PATHOLOGIC DIAGNOSIS: Skeletal muscle with mitochondrial abnormalities

Comment: The findings in this muscle biopsy are suggestive of a mitochondrial abnormality, but the features are not sufficiently developed to be diagnostic for a mitochondrial myopathy. The ultrastructural studies show abnormal mitochondrial paracrystalline inclusions and focal subsarcolemmal mitochondrial accumulation. No ragged red fibers are seen on H&E or trichrome stains, although some fibers show mildly increased subsarcolemmal staining for oxidative enzymes. The ATPase and fast and slow myosin stains show a predominance of type 2 muscle fibers. The oxidative enzyme stains including NADH and SDH show somewhat darker staining than expected for type 2 muscle fibers, likely reflecting a diffuse rather than focal increase in mitochondrial content that would be difficult to appreciate on ultrastructural studies.

- Gene Dx Mitochondrial DNA testing normal

Stanford MEDICINE

Previous workup

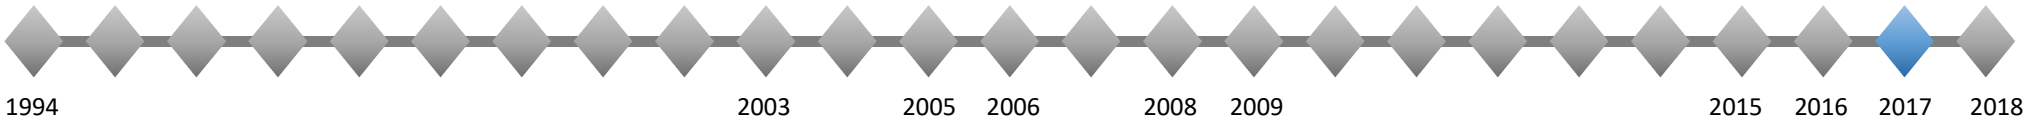


2016:

- Whole exome sequencing with two VUS:
  - Fukutin-related protein (FKRP)
    - c. 421 C>A heterozygous from mother
  - Sarcoglycan alpha subunit (SCGA)
    - c.469G>C heterozygous from father

Stanford MEDICINE

Previous workup



2017:

- EMG/NCS “These abnormal electrodiagnostic studies provide evidence for a prejunctional disorder of the neuromuscular junction.”

Stanford MEDICINE

Stanford MEDICINE

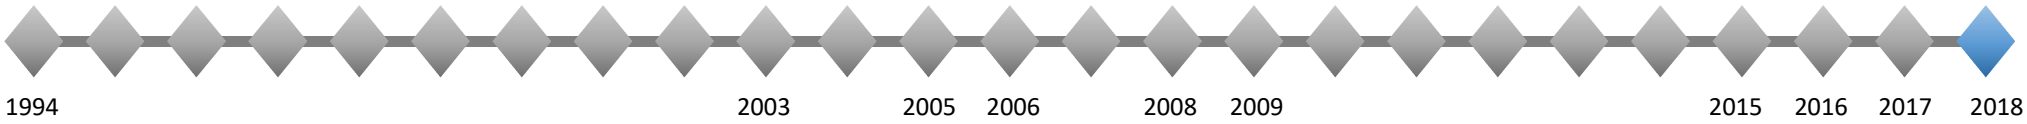
Further workup



2018:

- Repeat evaluation of whole exome sequencing identifies novel mutation in synaptotagmin 2 (gene SYT2)
  - p.L365P, c.1094T>C heterozygous de novo

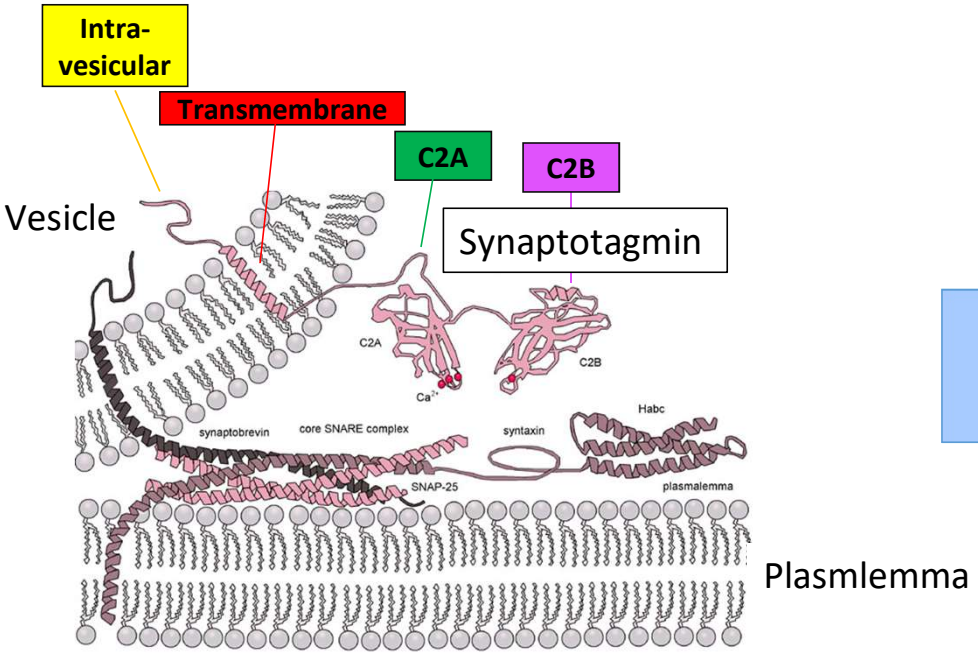
Stanford MEDICINE

Synaptotagmin 2

Functions:

- Calcium detector for fast, synchronized acetylcholine release
- Reducing asynchronous, slow release

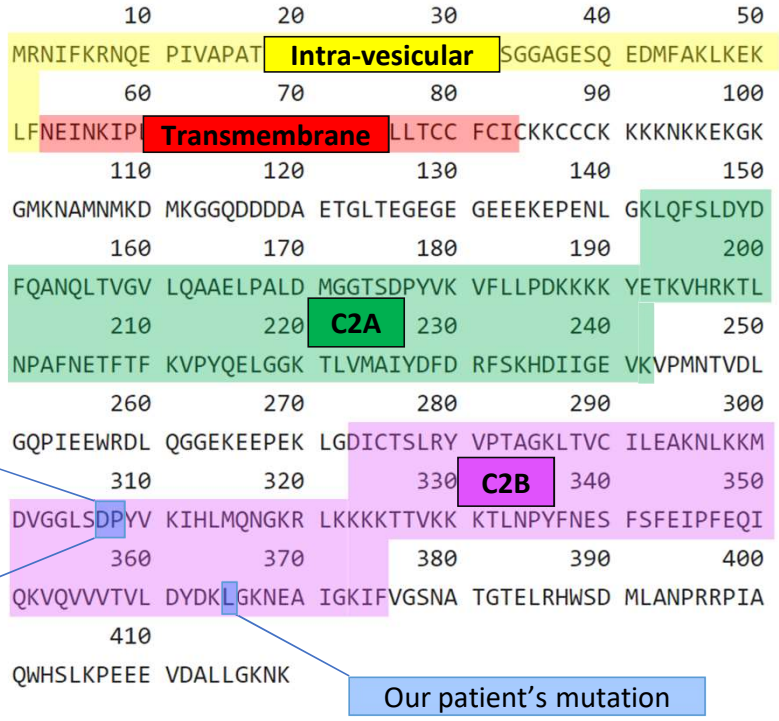
Structure:



Plasmlemma

DD Georgiev et. al. Nano and Molecular Electronics Handbook. 2007

Sequence in humans:



Previously reported pathogenic mutations

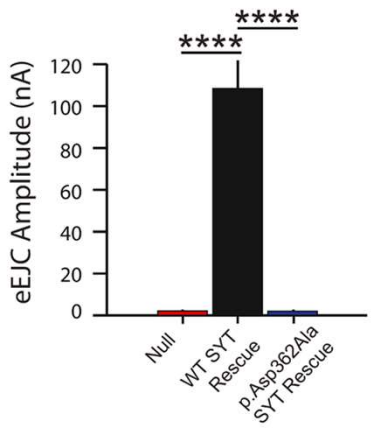
Our patient's mutation

Stanford MEDICINE

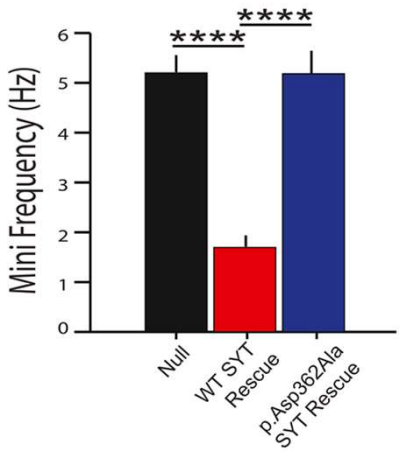
Previously reported SYT2 mutations

- Two families (US and UK) with autosomal dominant inheritance
- Variable penetrance – pattern of weakness, pes cavus, high arches common
- Repetitive nerve stimulation with baseline decrement and prolonged facilitation

Decreased synchronous release

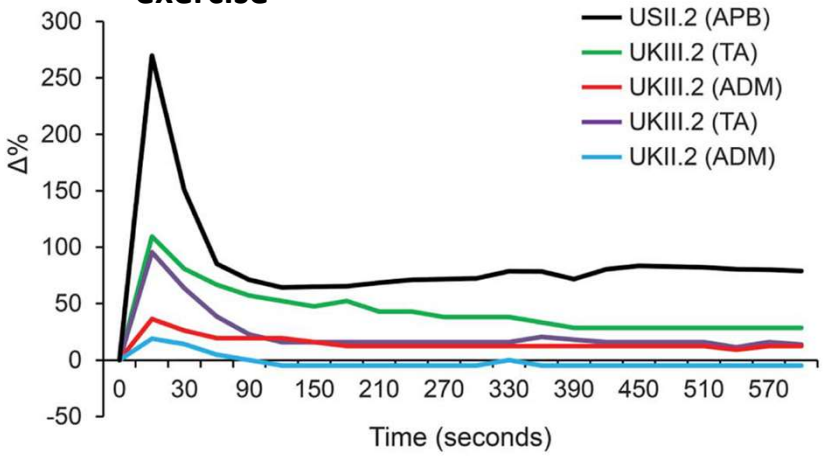


Increased asynchronous release



Hermann, et. al. Am. J. Hum. Gen. 2014

Prolonged facilitation after exercise



Whittaker, et. al. Neurology 2015

Stanford MEDICINE

Treatment of CMS

Treatment types:

- Acetylcholinesterase inhibitors
- 3,4 Diaminopyridine
- Beta-adrenergic agonists
- Channel blocking agents

Stanford MEDICINE

Treatment of CMS

Treatment types:

- Acetylcholinesterase inhibitors

- 3,4 Diaminopyridine
- Beta-adrenergic agonists
- Channel blocking agents

Acetylcholinesterase inhibitors:

Examples:
- pyridostigmine, neostigmine

Frequently useful for:
- Presynaptic syndromes, AChR deficiency, fast channel syndromes

Occasionally useful for:
- Congenital defect in glycosolation

Can worsen:
- Acetlycholinesterase deficiency, slow channel syndromes, most endplate maintenance syndromes

Contraindications:
lower dose in renal insufficiency

Stanford MEDICINE

Treatment of CMS

Treatment types:
- Acetylcholinesterase inhibitors
- **3,4 Diaminopyridine**
- Beta-adrenergic agonists
- Channel blocking agents

3,4-diaminopyridine:

Examples:
- 3,4-diaminopyridine, amifampridine (Firdapse®)

Frequently useful for:
- Presynaptic syndromes

Occasionally useful for:
- Primary acetylcholine receptor deficiency

Can worsen:
- Acetlycholinesterase deficiency, slow channel syndromes, most endplate maintenance syndromes

Contraindications:
Seizures

Stanford MEDICINE

Treatment of CMS

Treatment types:
- Acetylcholinesterase inhibitors
- 3,4 Diaminopyridine
- **Beta-adrenergic agonists**
- Channel blocking agents

Beta-adrenergic agonists:

Examples:
- Oral albuterol, salambutol, ephedrine

Frequently useful for:
- none

Occasionally useful for:
- endplate maintenance syndromes, Acetylcholinesterase deficiency

Can worsen:
- None

Contraindications:
Use of MAOs and SDRIs, general anesthesia

Stanford MEDICINE

Treatment of CMS

Treatment types:
- Acetylcholinesterase inhibitors
- 3,4 Diaminopyridine
- Beta-adrenergic agonists
- **Channel blocking agents**

Channel blocking agents:

Examples:
- Fluoxetine, quinidine

Frequently useful for:
- Slow channel syndromes

Occasionally useful for:
- none

Can worsen:
- Fast channel syndromes

Contraindications:
- Quinidine – cardiac arrythmia, cardiomyopathy

Stanford MEDICINE

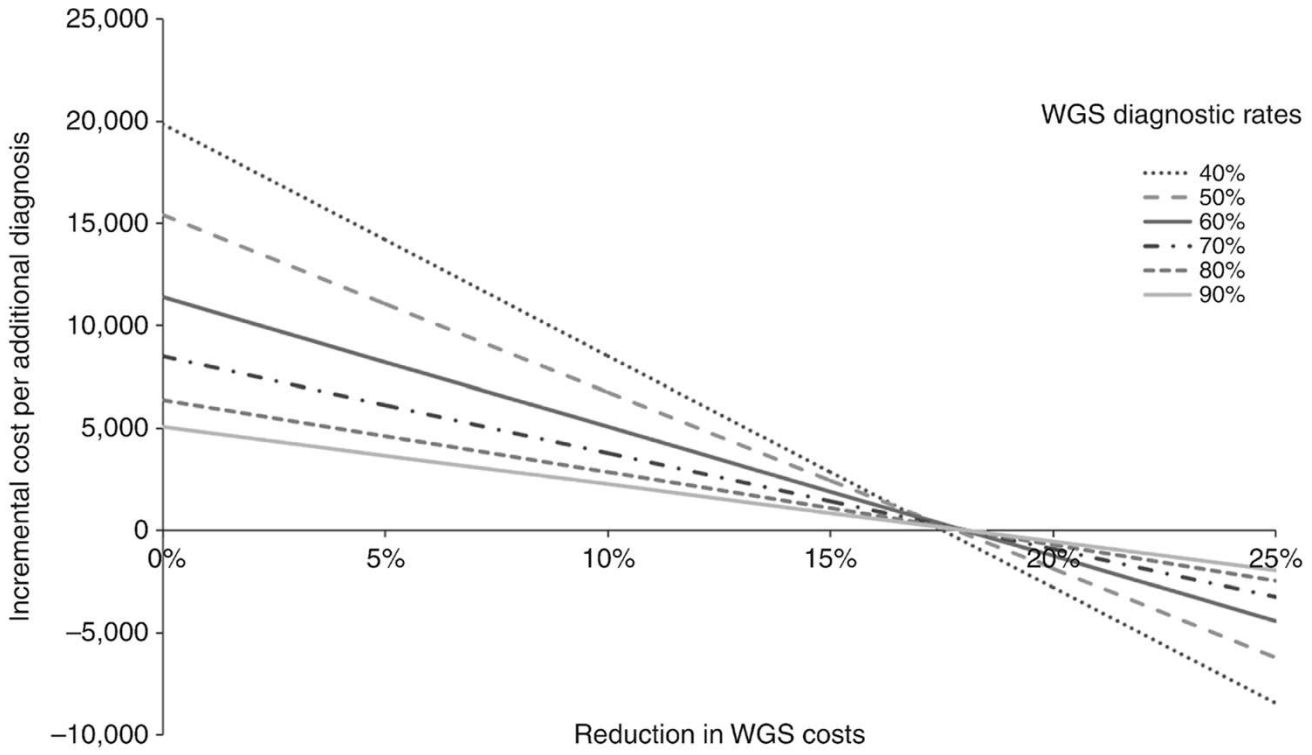
Cost effectiveness of whole genome vs whole exome



LJ Ewans et. al. Genet Med. 2018 Mar 29

Stanford MEDICINE

Controversy surrounding 3,4-DAP

Jacobus Pharmaceuticals (Princeton, NJ)	Catalyst Pharmaceuticals (Coral Gables, FL) - Firdapse®
Compassionate use since 1980s	EU approval for LEMS since 2009 FDA approval 11/28/18
	Orphan Drug Act with priority review and breakthrough therapy designation
	Firdapse® will have 7 year marketing exclusivity
	Ongoing trials in MuSK+ myasthenia gravis and SMA 3

Stanford MEDICINE

Lessons from the case

1. Importance of genetic diagnosis in congenital myasthenic syndromes
   - Periodic re-analysis of genetic testing may be indicated

2. Treatments are available but can worsen some conditions

2. CNS manifestations of presynaptic disorders are not well characterized

Stanford MEDICINE
