

# Update in Internal Medicine 2022

---

## COVID-19 Update: Where are we now?

James “Brad” Cutrell, MD FIDSA

Associate Professor of Internal Medicine

Division of Infectious Diseases and Geographic Medicine

UT Southwestern Medical Center

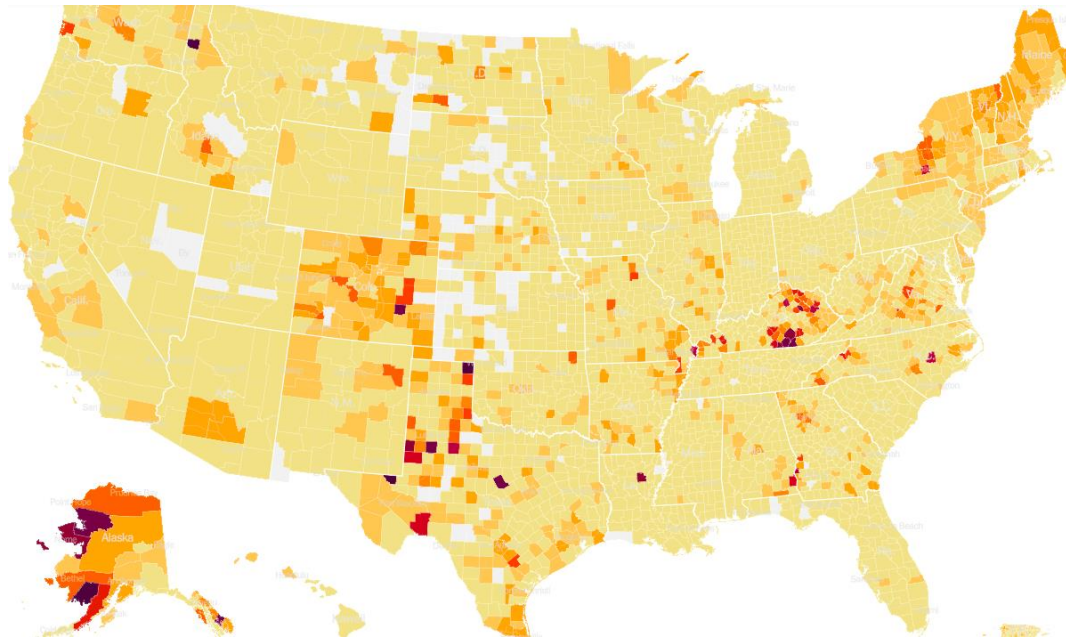

# Disclosures

- I have no financial disclosures.
- I served as an unpaid co-investigator for COVID-19 clinical trials from Gilead, Regeneron, and the NIH.
- I will be discussing off-label and emergency use authorized treatments for COVID-19.

# Outline

- COVID-19 Epidemiology and Emerging Variants
- COVID-19 Management and Prevention Updates
- COVID-19 Vaccination Updates

# COVID-19 in the United States

## Vaccinations

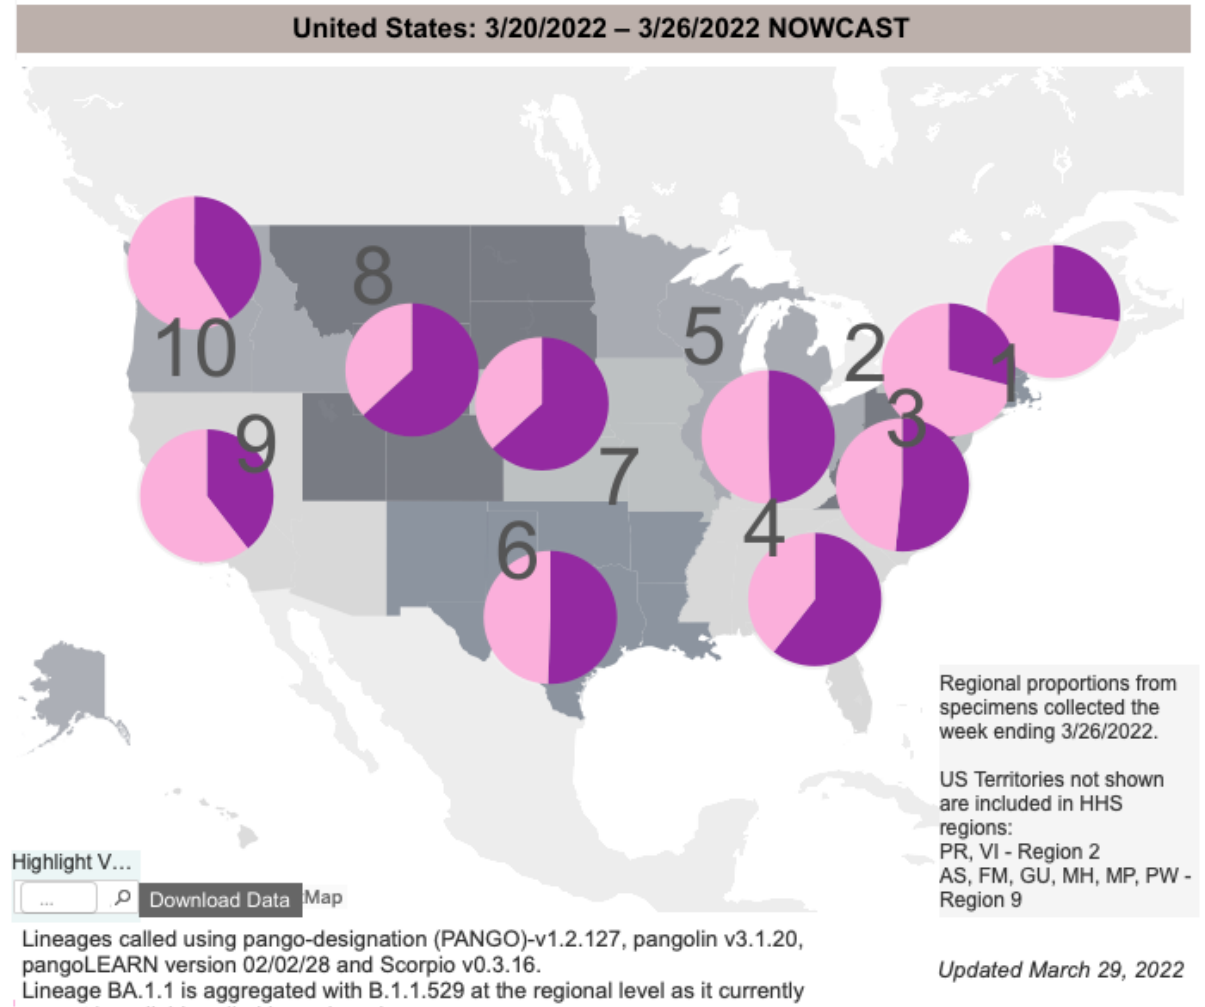

## New reported cases

|              | DAILY AVG. ON MAR. 30 | 14-DAY CHANGE | TOTAL REPORTED |
|--------------|-----------------------|---------------|----------------|
| Cases        | 27,621                | -12%          | 79,969,941     |
| Tests        | 888,308               | +7%           | —              |
| Hospitalized | 17,092                | -33%          | —              |
| In I.C.U.s   | 2,700                 | -40%          | —              |
| Deaths       | 702                   | -44%          | 978,387        |

► About this data

# COVID-19 Variants in the US

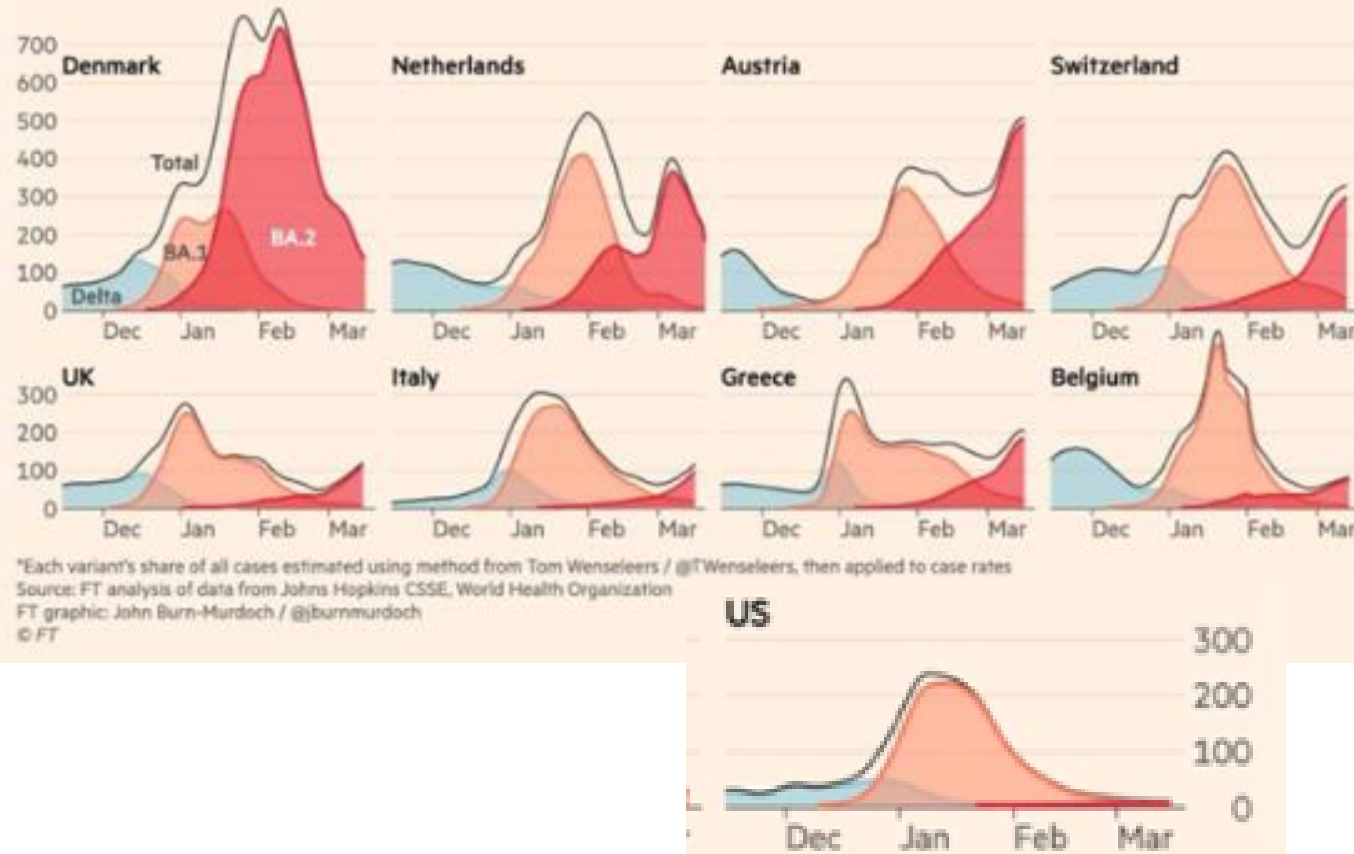

# Omicron Subvariants: BA.1 vs. BA.2

The BA.2 Omicron sublineage has displaced the original strain and is driving new surges in cases across Europe, with Denmark and the Netherlands now past their BA.2 peaks

7-day average of new confirmed cases per 100k people, by variant\*

\*Each variant's share of all cases estimated using method from Tom Wenseleers / @TWenseleers, then applied to case rates  
 Source: FT analysis of data from Johns Hopkins CSSE, World Health Organization  
 FT graphic: John Burn-Murdoch / @burnmurdoch  
 © FT

BA.2: More transmissible, similar disease severity and vaccine efficacy to BA.1

| Feature                                    | BA.1               | BA.2                               |
|--|--------------------|------------------------------------|
| Transmission (infectiousness)              | Reference          | 30% higher                         |
| Viral Load                                 | Reference          | Nearly 2-fold                      |
| Mutations in Spike                         | Reference          | 8 different, not shared            |
| Neutralizing antibodies median titer       | Reference          | Lower level, ~70%                  |
| Disease-causing potential (virulence)      | Reference          | Same, but infects many more people |
| 2-shot effectiveness vs hospitalizations*  |                    |                                    |
| Up to 6 months                             | 63% (95% CI 47,75) | 69% (95% CI 27,87)                 |
| Past 6 months                              | 32% (95% CI 11,49) | 50% (95% CI 7,73)                  |
| 3-shot effectiveness vs hospitalizations * |                    |                                    |
| Up to 70-days                              | 81% (95% CI 75,85) | 83% (95% CI 71,91)                 |
| Past 70-days                               | 73% (95% CI 65,79) | 70% (95% CI 50,82)                 |

\*data from UKHSA March 24 report using Emergence Care dataset, includes "for" and "with" Covid so under-estimates effectiveness

@erictopol

# Outline

- COVID-19 Epidemiology and Emerging Variants
- **COVID-19 Management and Prevention Updates**
- COVID-19 Vaccination Updates

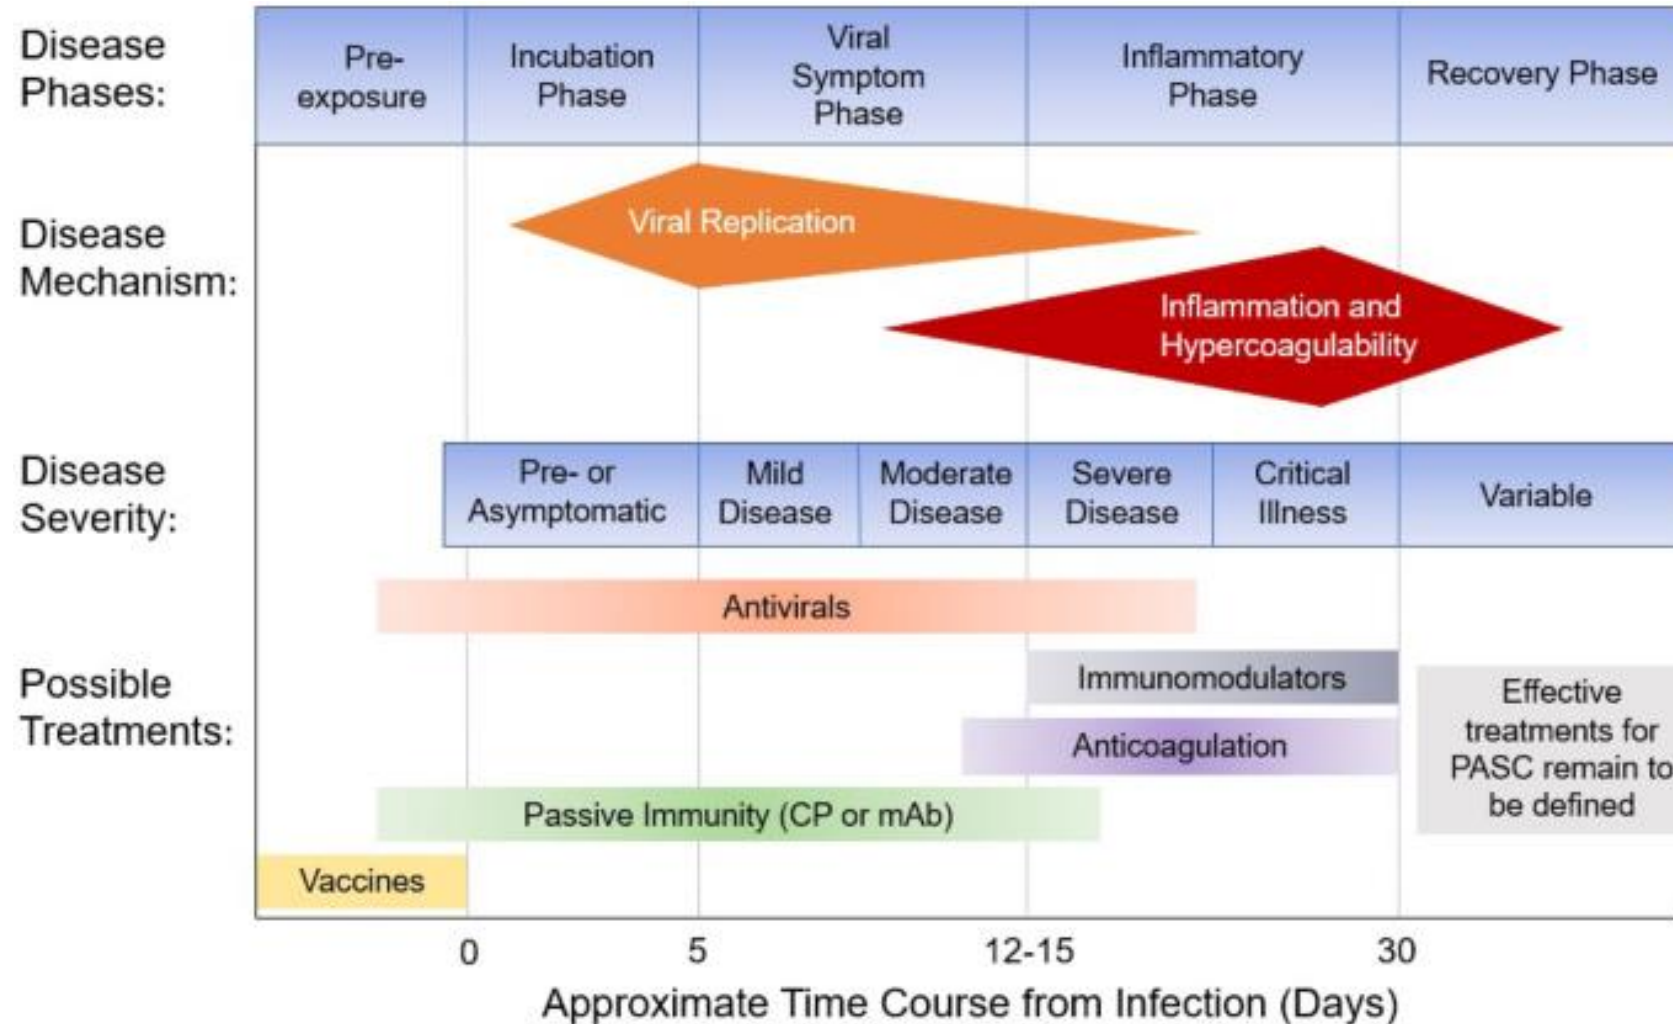

# COVID-19 Disease Severity Classification

| Disease Category      | Clinical Definition   |
|-----------------------|---|
| Asymptomatic COVID-19 | Viral replication without symptoms  |
| Mild COVID-19         | Symptomatic, no hypoxia or signs of PNA, no ongoing medical care  |
| Moderate COVID-19     | Symptomatic, signs of PNA or ongoing medical care <b>but no hypoxia at rest (<math>O_2 \geq 94\%</math> on room air)</b>  |
| Severe COVID-19       | <b>Hypoxic at rest (<math>O_2 &lt; 94\%</math> on room air)</b> , RR > 30, P/F ratio < 300, >50% lung infiltrates; some subdivide between low-flow vs. high-flow $O_2$ /NIV |
| Critical COVID-19     | ARDS or septic shock; requiring Mechanical ventilation or ECMO  |

Must pay attention to trial methods because some define these categories differently, particularly severe disease

# COVID-19 Therapeutics: Where are we now?

# Antivirals

- Agents directly targeting SARS-CoV-2 replication
- Likely work best in early viral phase or as prophylaxis
- Example Agents
  - Remdesivir (RDV)
  - Nirmatrelvir/ritonavir (Paxlovid)
  - Molnupiravir

# Updated Remdesivir Meta-Analysis

- Updated RDV meta-analysis including 8 RCTs (latest CATCO trial), 9157 patients
- Risk ratio for mortality based on baseline oxygen needs:
  - MV: 1.19 (0.98-1.44)
  - On O<sub>2</sub>: **0.83 (0.73-0.95)**
  - No O<sub>2</sub>: 0.71 (0.42-1.22)

Figure 1 – Random Effects Meta-Analysis

\*Excludes patients already included in SOLIDARITY (NEJM 2020)

# Outpatient Short-course Remdesivir

- PINETREE trial: High-risk symptomatic outpatients  $\leq 7$  days of symptom onset received 3 days of RDV
- Inclusion:  $\geq 60$  years old or at least one high risk factor
- Exclusion: **Vaccinated, Requiring O<sub>2</sub> or hospitalization**
- 562 patient enrolled; Mean age 50, median sx duration 5 days; 62% DM2, 55% Obesity, 58% HTN, 4% immune compromised
- Primary outcome: Risk of hospitalization or death due to COVID-19 was 87% lower in RDV group
- Similar rate of ADEs in RDV and Placebo groups

| Outcome                                   | RDV group       | Placebo group    | P-value      |
|---|-----------------|------------------|--------------|
| COVID-19 hospitalization or death, day 28 | <b>2 (0.7%)</b> | <b>15 (5.3%)</b> | <b>0.008</b> |
| Any death, day 28                         | 0               | 0                |              |
| Any hospitalization, day 28               | 5 (1.8%)        | 18 (6.4%)        |              |

# Applying the Evidence: Remdesivir

- Best evidence in patients with severe COVID-19 but not intubated (low flow O<sub>2</sub> > high flow or noninvasive ventilation); no clear benefit in critical disease (mechanical ventilation)
- Compelling data in very early outpatient use but logistically challenging
- Modest clinical benefit, may reduce mortality in those on O<sub>2</sub>
- Practical considerations with RDV:
  - Default duration 5 d, might extend in MV/ECMO
  - Monitor LFTs daily, stop for ALT/AST > 10x upper limit of normal
  - Limited data in CKD (GFR < 30), however, can be used if benefit outweighs risk<sup>1</sup>
  - FDA-approved for COVID-19 hospitalized adults/teens, kids (<12 or <40 kg) via EUA

---

1. Adamsick ML, et al. JASN 2020; 31(7):1384-86.

# COVID-19 Oral Antivirals

- Two new EUA oral antivirals: Nirmatrelvir/ritonavir (Paxlovid) and Molnupiravir
- Demonstrated reduction in hospitalization in high-risk outpatients (89% for Paxlovid, ~30% for Molnupiravir)
- Approved for outpatient treatment of symptomatic patients with mild to moderate disease **within 5 days of symptom onset**
- Not approved for hospitalized patients
- Watch many drug-drug interactions with Paxlovid!
- Molnupiravir contraindication in pregnancy or caution in those trying to conceive

## Liverpool COVID-19 Drug Interaction Checker

The screenshot shows the Liverpool COVID-19 Drug Interaction Checker website. The header is green with the University of Liverpool logo and the text 'COVID-19 Drug Interactions'. Below the header is a navigation bar with links for 'About', 'Interaction Checkers', 'Prescribing Resources', and 'Contact Us'. A green banner below the navigation bar contains the text: 'Interactions with selected WHO Essential Medicines and Paxlovid (nirmatrelvir/ritonavir) now available in the Prescribing Resources section - click here'. Below the banner is a red warning message: 'If a drug is not listed below it cannot automatically be assumed it is safe to coadminister.' The main content area is divided into three columns: 'COVID Drugs' with a search box, 'Co-medications' with a search box, and 'Drug Interactions' with a checkbox labeled 'Check COVID/COVID drug Interactions' and the text 'Drug Interactions will be displayed here'.

# Immune System Mimics

- Agents mimic the immune system's response to SARS-CoV-2
- Likely work best early prior to body's own immune response or as prophylaxis
- Example Agents
  - SARS-CoV-2 Monoclonal Antibodies
  - Convalescent Plasma

# SARS-CoV-2 Monoclonal Ab

- 4 Monoclonal Ab with EUA for **mild to moderate COVID-19 in high-risk outpatients < 7 days from symptom onset**
- NOT currently approved for patients **hospitalized due to COVID-19** (but can be used if hospitalized for non-COVID-19 and meets EUA criteria)

| EUA Mab                     | Clinical Efficacy                                      | Predicted Efficacy against variants                               | Comments   |
|-----------------------------|--|---|--|
| Bamlanivimab/<br>etesevimab | 70% RRR in hospitalization or death (2% vs. 7%)        | Significant reduction for Delta, Gamma, and <b>Omicron</b>        | No longer in use due to Omicron                                      |
| Casirivimab/imdevimab       | 71% RRR in hospitalization or death (1.3% vs. 4.6%)    | Significant reduction for <b>Omicron</b>                          | No longer in use due to Omicron                                      |
| <b>Sotrovimab</b>           | 85% RRR in hospitalization or death (1% vs. 7%)        | Significant reduction for <b>Omicron BA.2 subvariant</b>          | Recommended by NIH (Alla); <i>distribution paused in some states</i> |
| <b>Bebtelovimab</b>         | More limited clinical efficacy data from phase 2 study | Retains <i>in vitro</i> activity for circulating Omicron variants | Recommended by NIH if others not available (CIII)                    |

# SARS-CoV-2 Mab Prophylaxis: Evusheld

- Two long-acting Mab (tixagevimab/cligavimab) with extended half-life up to 12 months protection
- EUA for prophylaxis in moderate/severe immunocompromised pts or those unable to be vaccinated
- PROVENT phase 3 prophylaxis trial: 5,197 participants (2:1 randomization), 75% with high-risk comorbidities, single 300 mg IM injection or saline IM placebo
- Recommended dose increased to 600 mg due to Omicron variants

|                           | AZD 7442 Arm | Placebo Arm | Relative Risk Reduction      |
|---------------------------|--------------|-------------|------------------------------|
| Symptomatic PCR + disease | 8            | 17          | <b>77% (95% CI: 46%-90%)</b> |
| Severe disease            | 0            | 3           |                              |
| Death                     | 0            | 2           |                              |

# Convalescent Plasma: Comeback Kid?

- RCT of high-titer convalescent plasma in outpatient COVID-19  $\leq 8$  days from sx onset
- Pre-Omicron era, 1225 enrolled,  $> 80\%$  unvaccinated
- Primary outcome: 54% RRR in risk of hospitalization with CP (2.9% vs 6.3%;  $p=0.005$ )
- **Take-home message:** Early, high-titer CP may have a role in outpatient COVID-19, *particularly in unvaccinated or immunocompromised*

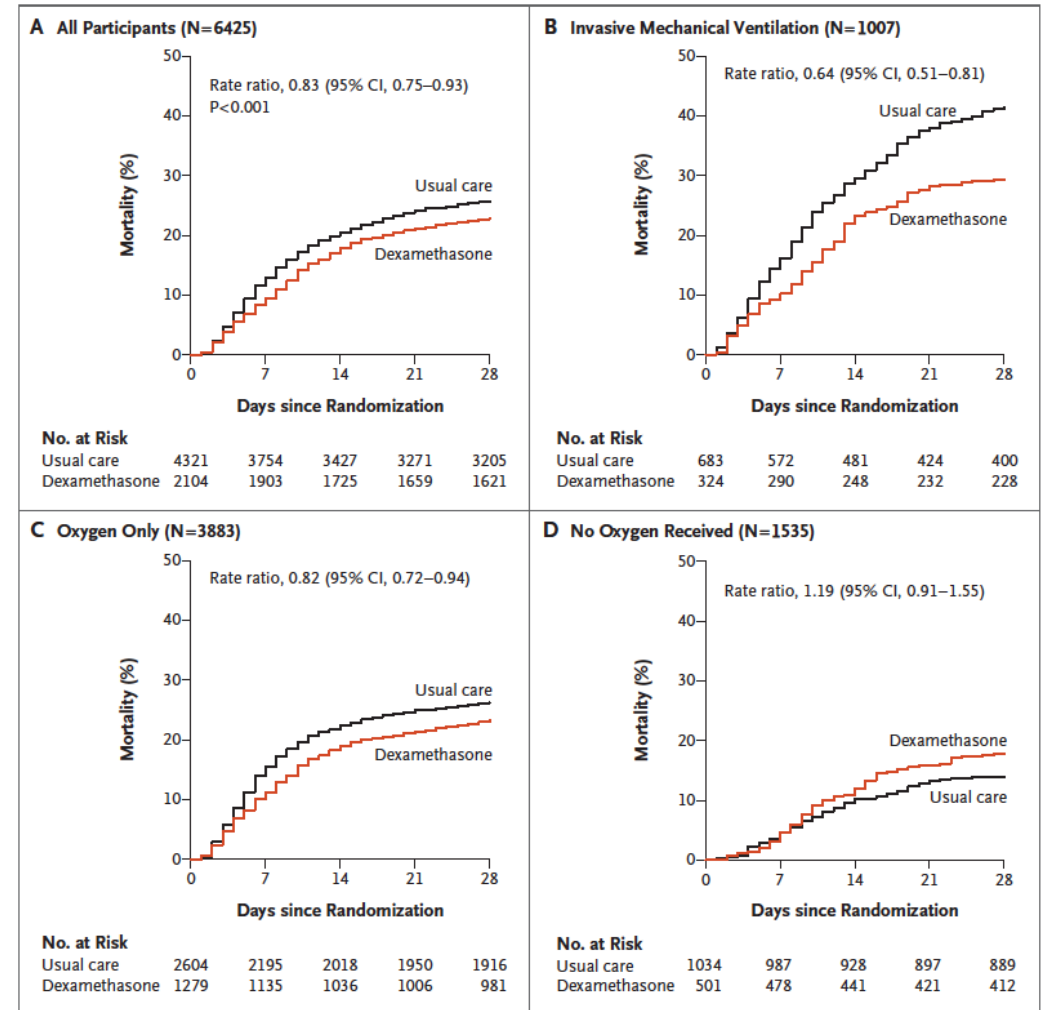

# Immunomodulators

- Agents dampen the host immune and inflammatory response to SARS-CoV-2
- Likely work best during host inflammatory phase or possibly in combination with antiviral agents
- Example Agents
  - Corticosteroids
  - Cytokine Inhibitors (e.g. IL-6)
  - JAK Pathway Inhibitors (e.g. baricitinib)

# Corticosteroids: RECOVERY Trial

- Open-label, adaptive COVID-19 trial in UK
- Dexamethasone 6 mg daily up to 10d (N=2104) vs. Usual Care (N=4321)
- 28 day Mortality Rate Ratios:
  - Overall: 0.83
  - On MV: 0.64 (Absolute RR  $\cong$  12%)
  - On O<sub>2</sub>: 0.82 (Absolute RR  $\cong$  3%)
  - No O<sub>2</sub>: 1.19

# Applying the Evidence: Corticosteroids

- Strongest data for critically ill COVID-19
  - Give to all unless clear contraindication; optimal dosing less clear
  - Dexamethasone or IV methylprednisolone (2 mg/kg x 5 days, then taper for total of 10 days)
- Strong data for severe COVID-19 on O<sub>2</sub> (RECOVERY)
  - Give to most unless clear contraindication, usually combined with antiviral
- Do NOT use systemic steroids in those who are outpatient or not on O<sub>2</sub>
- Small trial supporting **inhaled** budesonide 800 mg BID in symptomatic outpatients

# Applying the Evidence: IL-6 and JAK inhibition

- Both IL-6 receptor and JAK inhibitors have shown mortality benefit in addition to standard of care (corticosteroids +/- remdesivir)
- **How to use and who is the right patient population?**
- IL-6R antagonists: Tocilizumab, weight-based dosing, single dose
- Use in those progressing to higher O<sub>2</sub> or intubation (< 24h) despite steroids, especially if CRP > 75
- JAK Inhibitors (baricitinib): 4 mg PO daily up to 14d, dose reduce in CKD
- Can use either as alternative if steroids contraindicated OR in addition to steroids in those progressing to higher O<sub>2</sub> or mechanical ventilation

# COVID-19 Anticoagulation (NIH Guidelines)

| Patient Population  | Therapeutic Dose Anticoagulation (LMWH preferred) | Prophylactic Dose Anticoagulation |
|---|---|-----------------------------------|
| Clinically suspected or diagnosed VTE/PE (AI)   | ✓   |                                   |
| Hospitalized nonpregnant patients on low-flow O <sub>2</sub> AND D-Dimer > ULN*(CIIa) | ✓   |                                   |
| Hospitalized patients requiring ICU level care or high-flow O <sub>2</sub> /NIV (AI)  |   | ✓                                 |
| All other hospitalized patients (including all pregnant patients) (BIII)              |   | ✓                                 |

\* Contraindications to therapeutic anticoagulation include: Platelets < 50k, Hgb < 8 mg/dL, Need for dual antiplatelet, ED visit or hospitalization for major bleeding in last 30 days, Inherited or known history of bleeding disorder.

# What is NOT currently recommended

- Routine bacterial antibiotics
- Hydroxychloroquine
- HIV protease inhibitors
- Ivermectin
- Colchicine
- IVIG
- Azithromycin (for COVID-19)
- Zinc, Vitamin C, Vitamin D (for COVID-19)

# Case #1

- 45 year old male with PMHx of NYHA III CHF, obesity, DM type 2 contacts the clinic with 2 days of fevers, cough, fatigue. His home pulsox is reading 96% on room air. He received 2 doses of Moderna vaccine in May. He had a prolonged exposure to a family friend last week who is now COVID+. **What do you recommend?**
- Immediate COVID-19 rapid Ag +/- PCR testing, Isolation
- Counsel and strongly recommend one of the following:
  - Monoclonal Ab treatment (Bebtelovimab or Sotrovimab)
  - Oral nirmatrelvir/ritonavir (Paxlovid)
  - Outpatient IV Remdesivir x 3 days

# Case #1: Outpatient COVID-19

- Key Pearls: Prioritize early outpt therapy in high risk patients; **Every high risk patient should have Mab action plan**
- Selling Point: 70-85% reduction in risk of hospitalization or death
- Oral nirmatrelvir/ritonavir also a good option if within 5 days of sx and no drug-drug interactions
- IV Remdesivir x 3 days also a choice but outpatient logistics more challenging

## **Mab EUA Criteria:**

Sx onset < 7 days  
Not hospitalized due to COVID  
No new or ↑ oxygen  
“High risk for progression”

## **Mab High Risk Criteria:**

Age > 65  
BMI > 25  
DM, CKD, Chronic heart/lung dz  
Immunosuppressed  
Others....

# Case #2

- 63 year old male with PMHx of obesity, COPD, HTN admitted with 6 days of fevers, HA, rhinorrhea, SOB. He was unvaccinated. COVID-19 PCR positive on admission, CXR shows bilateral interstitial infiltrates. O<sub>2</sub> sat 94% on 3L NC. LFTs 2x ULN. CRP 25 mg/L. **What do you recommend?**
- Dexamethasone 6 mg daily up to 10 days plus IV Remdesivir x 5 days
- At least ppx anticoagulation, possibly therapeutic
- Trend O<sub>2</sub> sats, LFTs, D-dimer, CRP
- No antibacterial antibiotics; Awake proning

# Case #2: Severe COVID-19 on low flow O<sub>2</sub>

## Key Pearls:

- Dexamethasone and Remdesivir mainstay of Rx
- Secondary bacterial infection rare, no abx needed in most cases
- Assess anticoagulation level based on bleeding risk
- Awake proning may benefit, no cost intervention
- Trend O<sub>2</sub>, LFTs, D-dimer and CRP
- If O<sub>2</sub> needs progressing rapidly, can consider adding baricitinib or tocilizumab
- Cannot use Mab via EUA but can consider compassionate use if Ab negative

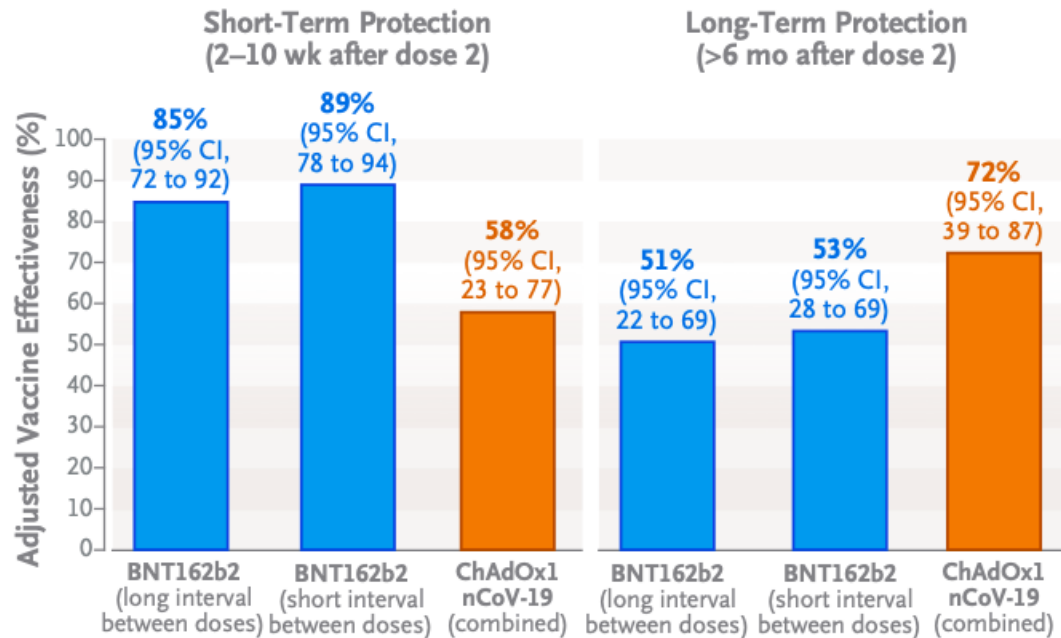

# Outline

- COVID-19 Epidemiology and Emerging Variants
- COVID-19 Management and Prevention Updates
- COVID-19 Vaccination Updates

# Vaccine and Infection-induced Immunity

Prospective UK cohort of > 35,000 HCWs from Dec 2020-Sept 2021 (pre-Omicron)

**Vaccine Effectiveness over Time in Previously Uninfected Participants**

**Protection against Reinfection in Previously Infected Participants**

Robust vaccine immune protection against infection (esp. mRNA) that wanes > 6 months

Robust infection-induced immune protection that is further boosted with vaccination

# CDC Vaccine Recs: Non-Immunocompromised

## COVID-19 Vaccination Schedule\*

| Vaccine  | 0 month                    | 1 month  | 2 month | 3 month   | 4 month | 5 month | 6 month   | 7 month  | 8 month | 9 month | 10 month   | 11 month |
|--|----------------------------|--|---------|---|---------|---------|---|--|---------|---------|--|----------|
| <b>Pfizer-BioNTech (ages 5-11 years)</b>         | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose</b><br>(3 weeks after 1 <sup>st</sup> dose)               |         |   |         |         |   |  |         |         |  |          |
| <b>Pfizer-BioNTech (ages 12 years and older)</b> | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose<sup>1</sup></b><br>(3-8 weeks after 1 <sup>st</sup> dose) |         |   |         |         | <b>Booster Dose<sup>2</sup></b><br>(at least 5 months after 2 <sup>nd</sup> dose) |  |         |         | <b>2<sup>nd</sup> Booster Dose<sup>3</sup></b><br>(See footnote) |          |
| <b>Moderna (ages 18 years and older)</b>         | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose<sup>1</sup></b><br>(4-8 weeks after 1 <sup>st</sup> dose) |         |   |         |         | <b>Booster Dose<sup>2</sup></b><br>(at least 5 months after 2 <sup>nd</sup> dose) |  |         |         | <b>2<sup>nd</sup> Booster Dose<sup>3</sup></b><br>(See footnote) |          |
| <b>Janssen (ages 18 years and older)</b>         | <b>1<sup>st</sup> Dose</b> |  |         | <b>Booster Dose<sup>2</sup></b><br>(at least 2 months after 1 <sup>st</sup> dose) |         |         |   | <b>2<sup>nd</sup> Booster Dose<sup>3</sup></b><br>(See footnote) |         |         |  |          |

Note: Timeline is approximate. Intervals of 3 months or fewer are converted into weeks per the formula "1 month = 4 weeks." Intervals of 4 months or more are converted into calendar months.

2<sup>nd</sup> Booster Dose now an option for those ≥ 50 years old

- Greatest likely benefit in those ≥ 65 years old or with chronic medical conditions
- Those with recent Omicron infection can likely delay booster shot

# CDC Vaccine Recs: Immunocompromised

## COVID-19 Vaccination Schedule

For Those who are Moderately or Severely Immunocompromised

| Vaccine  | 0 month                    | 1 month   | 2 month   | 3 month  | 4 month | 5 month   | 6 month | 7 month  | 8 month | 9 month  |
|--|----------------------------|---|---|--|---------|---|---------|--|---------|--|
| <b>Pfizer-BioNTech (ages 5-11 years)</b>         | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose</b><br>(3 weeks after 1 <sup>st</sup> dose)  | <b>3<sup>rd</sup> Dose</b><br>(At least 4 weeks after 2 <sup>nd</sup> dose) |  |         |   |         |  |         |  |
| <b>Pfizer-BioNTech (ages 12 years and older)</b> | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose</b><br>(3 weeks after 1 <sup>st</sup> dose)  | <b>3<sup>rd</sup> Dose</b><br>(At least 4 weeks after 2 <sup>nd</sup> dose) |  |         | <b>Booster Dose<sup>1</sup></b><br>(at least 3 months after 3 <sup>rd</sup> dose) |         |  |         | <b>2<sup>nd</sup> Booster Dose<sup>3</sup></b><br>(See footnote) |
| <b>Moderna (ages 18 years and older)</b>         | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> Dose</b><br>(4 weeks after 1 <sup>st</sup> dose)  | <b>3<sup>rd</sup> Dose</b><br>(At least 4 weeks after 2 <sup>nd</sup> dose) |  |         | <b>Booster Dose<sup>1</sup></b><br>(at least 3 months after 3 <sup>rd</sup> dose) |         |  |         | <b>2<sup>nd</sup> Booster Dose</b><br>(See footnote)             |
| <b>Janssen (ages 18 years and older)</b>         | <b>1<sup>st</sup> Dose</b> | <b>2<sup>nd</sup> (Additional) Dose<sup>2</sup> using an mRNA COVID-19 Vaccine</b><br>(At least 4 weeks after 1 <sup>st</sup> dose) |   | <b>Booster Dose<sup>1</sup></b><br>(at least 2 months after additional dose) |         |   |         | <b>2<sup>nd</sup> Booster Dose<sup>3</sup></b><br>(See footnote) |         |  |

Note: Timeline is approximate. Intervals of 3 months or fewer are converted into weeks per the formula "1 month = 4 weeks." Intervals of 4 months or more are converted into calendar months.

# Conclusions

- Cases and hospitalizations are currently at nadir after Omicron surge but likely to see a new wave in the summer due to new variants, waning immunity
- Outpatient therapies focus on early initiation of oral antivirals, Mabs, or short course IV Remdesivir (if available)
- Cornerstone of inpatient treatment for those with severe disease (on O2) remains IV remdesivir plus steroids (+/- other immunomodulators)
- Vaccine recommendations on boosters continue to evolve with changing science and new variants

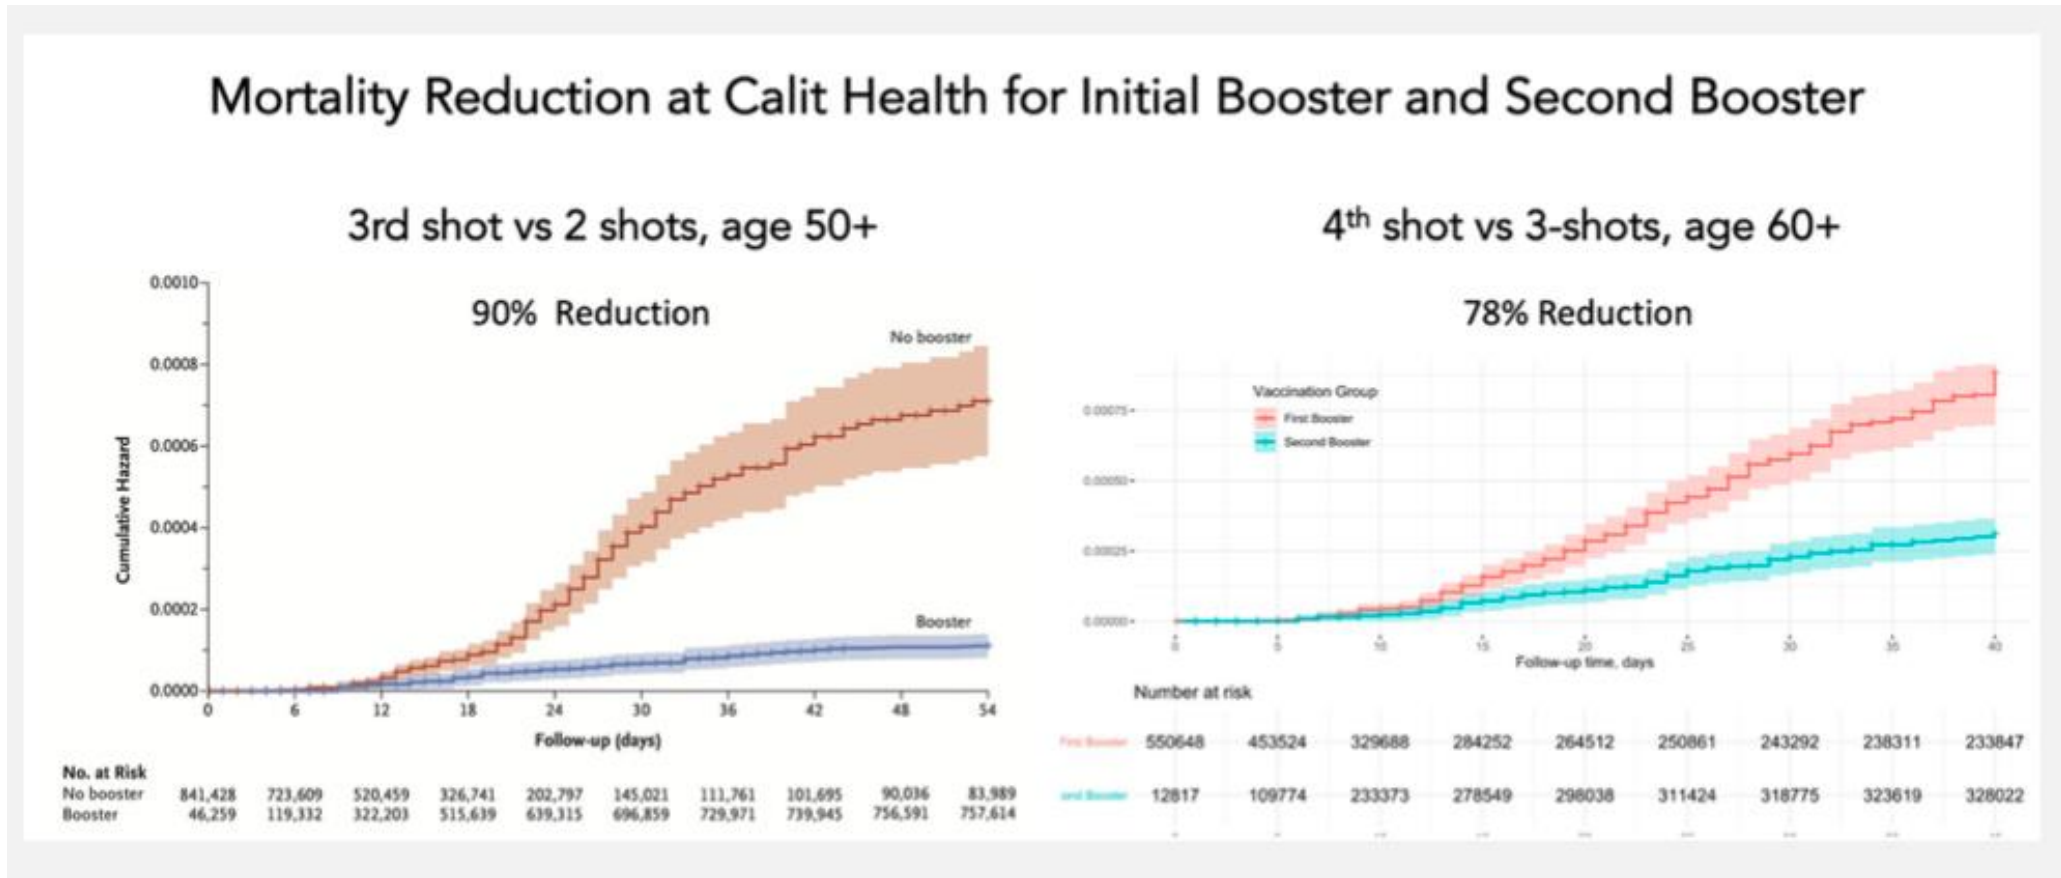

# Questions?

# Extra Slides

# 4<sup>th</sup> Dose COVID-19 Booster: Israel Clalit Health

Pre-print retrospective cohort of > 560k patients > 60 yo in large Israeli Health System

# TOGETHER Ivermectin COVID-19 Trial

Largest and most rigorous  
RCT of early ivermectin  
treatment in COVID-19  
showed no benefit in reducing  
disease progression

## METHODS

We conducted a double-blind, randomized, placebo-controlled, adaptive platform trial involving symptomatic SARS-CoV-2–positive adults recruited from 12 public health clinics in Brazil. Patients who had had symptoms of Covid-19 for up to 7 days and had at least one risk factor for disease progression were randomly assigned to receive ivermectin (400  $\mu\text{g}$  per kilogram of body weight) once daily for 3 days or placebo. (The trial also involved other interventions that are not reported here.) The primary composite outcome was hospitalization due to Covid-19 within 28 days after randomization or an emergency department visit due to clinical worsening of Covid-19 (defined as the participant remaining under observation for >6 hours) within 28 days after randomization.

## RESULTS

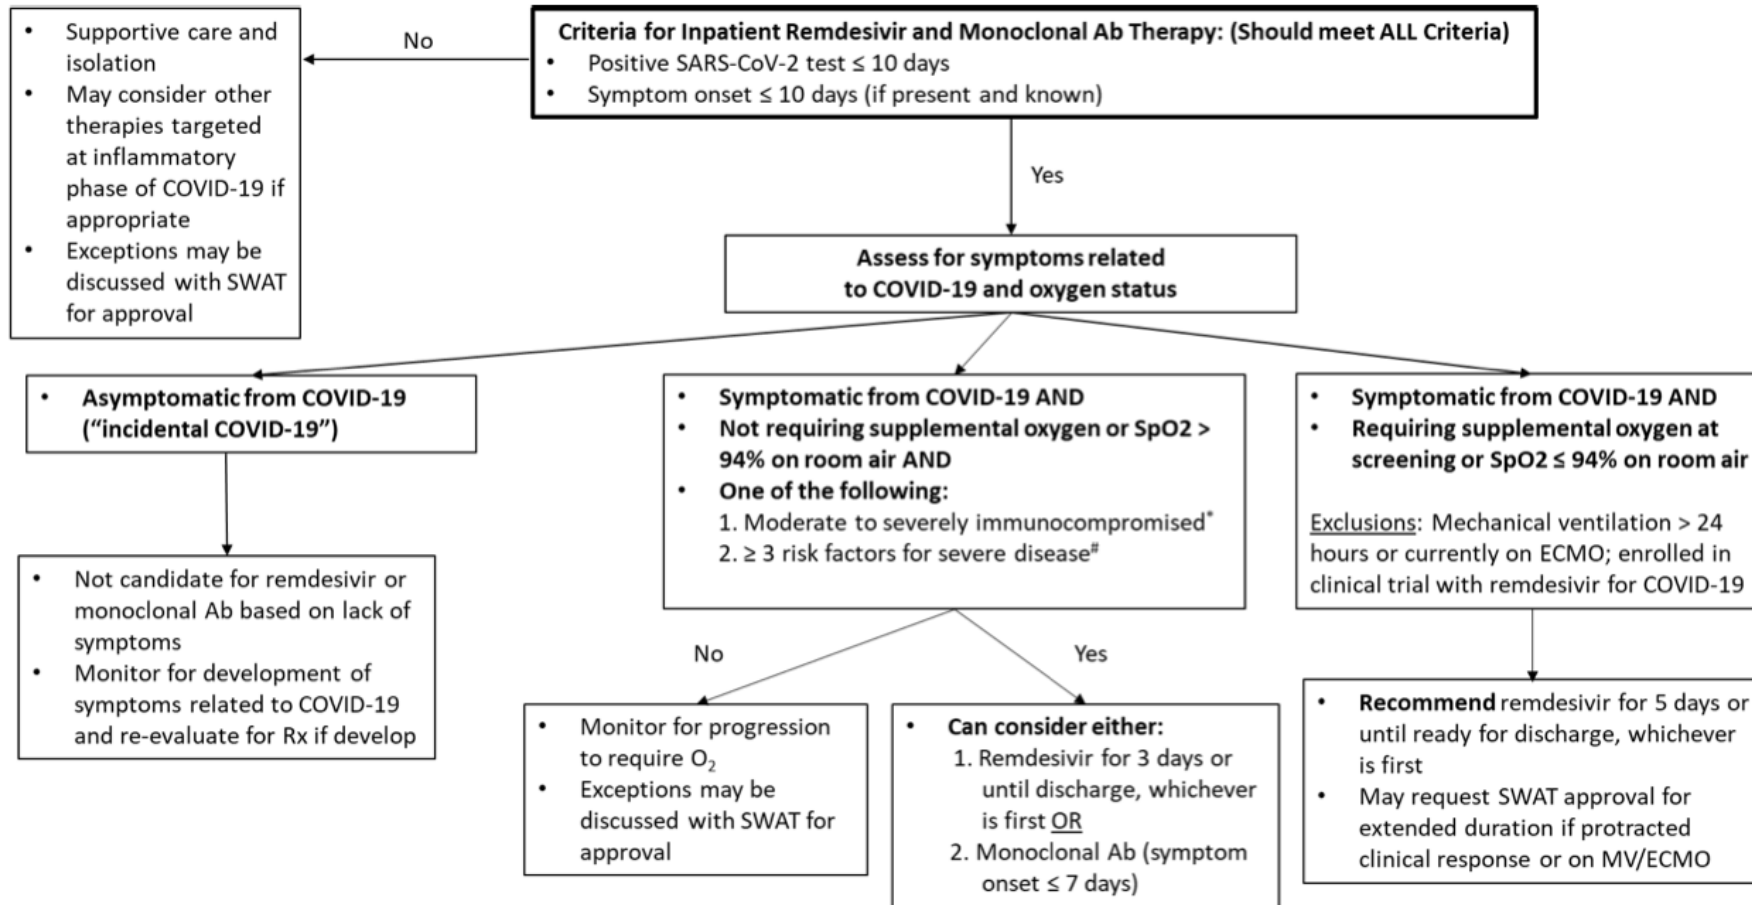

A total of 3515 patients were randomly assigned to receive ivermectin (679 patients), placebo (679), or another intervention (2157). Overall, 100 patients (14.7%) in the ivermectin group had a primary-outcome event, as compared with 111 (16.3%) in the placebo group (relative risk, 0.90; 95% Bayesian credible interval, 0.70 to 1.16). Of the 211 primary-outcome events, 171 (81.0%) were hospital admissions. Findings were similar to the primary analysis in a modified intention-to-treat analysis that included only patients who received at least one dose of ivermectin or placebo (relative risk, 0.89; 95% Bayesian credible interval, 0.69 to 1.15) and in a per-protocol analysis that included only patients who reported 100% adherence to the assigned regimen (relative risk, 0.94; 95% Bayesian credible interval, 0.67 to 1.35). There were no significant effects of ivermectin use on secondary outcomes or adverse events.

## CONCLUSIONS

Treatment with ivermectin did not result in a lower incidence of medical admission to a hospital due to progression of Covid-19 or of prolonged emergency department observation among outpatients with an early diagnosis of Covid-19.
